

Sales Performance Dashboard

Project Summary

Data Preparation & Cleaning

The dataset consists of four tables: Customer_Dim, Product_Dim, Store_Dim, and Sales_Fact. Initial steps included importing data into Excel, converting ranges into structured tables, and validating row and column counts. Data cleaning involved removing duplicates, handling missing values, correcting inconsistent formats, and ensuring data consistency across all tables.

In the Customer_Dim table, a derived column called Loyalty_Level was created using IF conditions based on age groups (Bronze, Silver, Gold, Platinum). Gender, country, city, and age values were standardized to ensure consistency. In the Product_Dim table, Product_ID format inconsistencies were corrected, and missing cost and stock values were filled using median values. Sales_Fact data was validated and missing numerical values were handled using mean or median where appropriate.

Data Analysis & Modeling

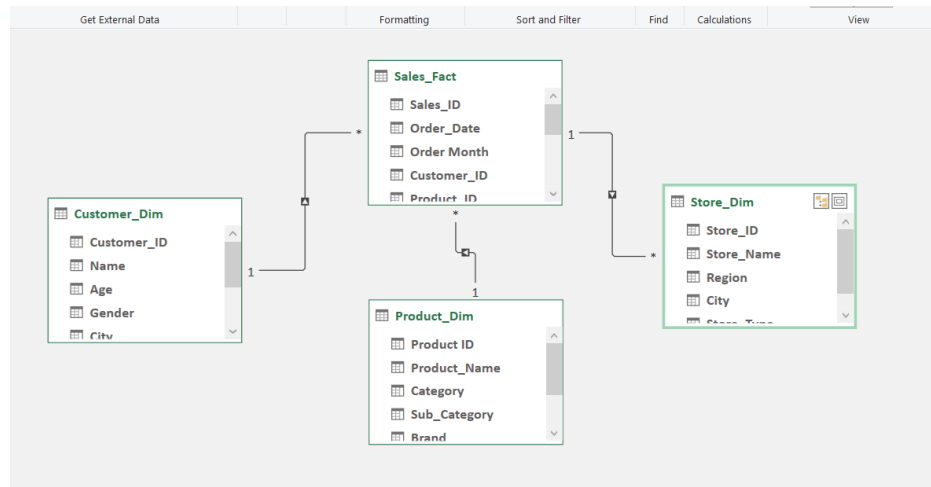

Excel formulas such as SUM, AVERAGE, IF, COUNTIF, TEXT, and XLOOKUP were used for calculations and data enrichment. Descriptive statistics including mean and standard deviation were calculated using Excel's Data Analysis ToolPak to understand sales variability.

Relationships were established between the Sales_Fact table and dimension tables using primary and foreign keys, forming a star schema data model. Pivot Tables were created to summarize sales by category, region, payment method, brand, and month.

Visualization & Dashboard

Multiple visualizations including column charts, bar charts, pie charts, and line charts were created using PivotCharts. An interactive dashboard was designed using slicers for category, region, payment type, and month. Key Performance Indicators (KPIs) such as Total Sales, Average Sales, Total Orders, and PayPal Orders were displayed for quick performance evaluation.

Project Screenshots with Explanation

I created relationship with 3 tables based on sales fact table

I Created Multiple pivot tables to total sale performance

Finally I create Sales Dashboard

Conclusion

This project demonstrates effective use of Excel for data cleaning, analysis, visualization, and reporting. By combining structured data modeling with interactive dashboards and clear insights, the project supports data-driven business decision-making.
